Appendix C: Additional Robustness analyses

I conduct a number of additional analyses as robustness checks, including dropping variables that may have potential collinearity problems, separating democratic countries and non-democratic countries, using a dichotomous measure of counterterrorism aid, and including a lagged dependent variable. The results are presented in Table I.

First, as the main results show, democracy and economic development are two important determinants of FDI. These two variables, however, may not only be highly correlated with each other, but also may explain most of the variation.¹ To avoid these problems, I drop democracy and/or economic development from the model. Model 1 in Table I excludes democracy, Model 2 excludes economic development, and Model 3 excludes both. As can be seen, excluding democracy and/or development does not change the main results.

Second, I separate democracies and non-democracies since their abilities to attract FDI and their vulnerability to terrorism may differ. Model 4 includes only democracies (Polity score ≥ 6), and Model 5 includes non-democracies. As Model 4 shows, the results are pretty robust for democracies. For non-democracies, the coefficient of terrorism is negative but does not achieve statistical significance, probably because in reality terrorism prevails more in the democratic world. The interaction term, however, remains positive and statistically significant.

Third, I use a dichotomous measure of counterterrorism aid, which is equal to 1 as long as a country received any positive amount of counterterrorism aid in that year and 0 otherwise. Model 6 displays the results, which remain unchanged.

Finally, I include lagged FDI in Model 7, and the results are not different from those when lagged FDI is excluded. All of these analyses indicate the robustness of the main results.

¹Thanks to an anonymous reviewer for pointing out this.
